

romartel.vercel.app

Comprehensive SEO, Lighthouse, GEO & AEO Audit

FULL AUDIT & TECHNICAL PERFORMANCE ASSESSMENT

SEO 8.5 / 10 <i>Strong</i>	GEO (AI) 8.0 / 10 <i>Strong</i>	AEO (Answers) 7.5 / 10 <i>On Track</i>	Lighthouse Avg 74 / 100 <i>Perf Bottleneck</i>
--	---	--	--

Audit Date: September 26, 2026

Prepared by Antigravity Technical & Marketing Audit Engine

1. Executive Summary

The online deployment at romartel.vercel.app represents a high-caliber technical portfolio designed with modern Next.js App Router architecture. The site achieves an exemplary 100/100 SEO score on Lighthouse and possesses strong Generative Engine Optimization (GEO) fundamentals through structured JSON-LD schemas and E-E-A-T credentials. However, the site suffers from a critical performance bottleneck (32/100 Mobile Performance) driven by heavy media payloads (totaling 10 MB on initial load, primarily rebusca.mp4 and metro.mp4), console runtime exceptions caused by uninitialized SVG motion paths, and two specific accessibility/indexing items: missing button accessible names in the contact terminal and dual H1 tags in the heading hierarchy.

Lighthouse Audit Scorecard (Mobile Emulation)

Category	Score	Status	Primary Finding / Cause
SEO	100 / 100	Exemplary	Perfect technical metadata, canonical link, mobile viewport, and crawlable links.
Accessibility	92 / 100	Strong	Contact terminal submit button missing aria-label; dormant scrollytelling contrast ratio.
Best Practices	73 / 100	Needs Attention	Repeated console errors: <path> attribute d "undefined" on Clippo motion SVGs; 3rd party cookies.
Performance (Mobile)	32 / 100	Critical	Massive 10 MB initial network payload: uncompressed project MP4 videos and GIF loaded upfront.

2. Core Web Vitals & Technical Performance

A deep dive into Lighthouse Core Web Vitals reveals that the site experience is throttled on simulated 4G mobile devices primarily due to media weight and initial JavaScript execution overhead:

Metric	Measured Value	Target Benchmark	Status
First Contentful Paint (FCP)	4.7 s	< 1.8 s	Slow
Largest Contentful Paint (LCP)	10.9 s	< 2.5 s	Poor
Total Blocking Time (TBT)	1,330 ms	< 200 ms	High
Speed Index	11.8 s	< 3.4 s	Slow
Total Network Payload	9,998 KiB (~10 MB)	< 1,600 KiB	Excessive

Largest Payload Culprits Breakdown

Over 85% of the total network transfer is consumed by unoptimized media files loaded on the homepage:

Asset URL / File	Transfer Size	Recommended Optimization
/rebusca.mp4	3,985 KiB (3.98 MB)	Lazy-load on viewport intersection; compress with Handbrake / AV1 codec.
/metro.mp4	3,918 KiB (3.91 MB)	Lazy-load on viewport intersection; serve WebM/AV1 streaming chunks.
/rebusca-preview.gif	572 KiB	Replace animated GIF with modern webm/mp4 or webp animation (est savings: 80%).
/projects/metropolycapng	453 KiB	Convert to modern WebP / AVIF format via next/image.

3. Search Engine Optimization (SEO) Analysis

Traditional search engines reward clean crawling semantics, singular heading hierarchies, fast delivery, and descriptive metadata.

SEO Signal	Observed Status on romartel.vercel.app	Verdict
Title Tag	58 chars: "Rodrigo Martel Marketing Operations & Systems Specialist". Within ideal 50-60 character range. Strong	Good

	keyword placement.	
Meta Description	152 chars: Highlights workflow automation (Make, Zapier, Python), CRM integrations (Salesforce, HubSpot), and data analytics. Ideal length.	Good
Heading Structure	Two <h1> elements detected: 1) "Rodrigo Martel" and 2) "Certifications& Credentials" (also missing space before ampersand). Only one H1 should exist per page.	Needs Attention
Canonical Tag	Valid self-referencing canonical URL: https://romartel.vercel.app .	Good
Crawl Directives	robots.txt allows all user agents, disallows /private/ and /api/, and references sitemap.xml. HTTP 200 on all endpoints.	Good
Hreflang & i18n	Sitemap defines en and es alternates, but both point to root URL without distinct path/subdomain. Root html tag hardcodes lang="en".	Needs Attention
Image Alt Text	100% of detected images have descriptive alt attributes. No missing alt tags found.	Good

4. Generative Engine Optimization (GEO) Analysis

Generative Engine Optimization prepares the site for AI search assistants (Perplexity, ChatGPT Search, Claude, Google AI Overviews). AI models parse entities, credentials, factual claims, and authoritative relationships.

GEO Signal	Observed Status & AI Retrieval Analysis	Verdict
E-E-A-T Entity Graph	Exceptional JSON-LD Person schema declaring job title, sameAs profiles (LinkedIn, GitHub, X), employer (HostPapa), and physical locality (San Salvador, SV).	Strong
Accredited Credentials	5 EducationalOccupationalCredential nodes mapped in JSON-LD (Google Data Analytics, Microsoft Power BI, HubSpot Inbound, CertiProf Scrum, Python Institute). Directly citable by LLMs.	Strong
Factual Claim Density	Rich quantifiable achievements (+240% leads, 99.4% uptime, 15k+ daily users, 1.2M records processed) give AI models verifiable facts to cite in recommendations.	Strong
LLMs.txt Standard	https://romartel.vercel.app/llms.txt returned HTTP 404. Implementing /llms.txt allows AI crawlers (e.g. Perplexity, ClaudeBot) to quickly consume a clean markdown digest of capabilities.	Missing
AI Crawl Permissions	robots.txt does not block GPTBot, PerplexityBot, ClaudeBot, or Google-Extended, ensuring full visibility in generative training and real-time retrieval sets.	Good

5. Answer Engine Optimization (AEO) Analysis

Answer Engine Optimization focuses on featured snippets, voice search queries, and conversational answer readiness.

AEO Signal	Observed Status & Direct Answer Viability	Verdict
------------	---	---------

FAQ Schema Markup	Complete FAQPage schema embedded in JSON-LD answering 3 core commercial queries (specialization, integration toolkit, booking/contact). Eligible for Google rich snippets.	Good
Conversational Agent	On-page Clippo AI assistant provides real-time question answering directly to visitors, serving as a live conversational answer layer.	Strong
Visible Question Headings	On-page headings are primarily editorial branding titles ("Start Small", "Think Big"). Introducing natural question subheadings ("How does Rodrigo automate CRM pipelines?") would enhance featured snippet win rates.	Opportunity

6. Priority Recommendations Matrix

Ranked by technical impact, SEO visibility, and user experience improvement:

Priority	Issue Description & Recommended Action	Area	Effort	Impact
Critical	Heavy video payloads (8 MB MP4s) loaded on page mount. Configure video tags with preload="none" or lazy-mount project media via IntersectionObserver so initial transfer drops below 2 MB.	Perf	Low	High
High	Fix console runtime error in Clippo SVG paths: ensure <motion.path> in ClippoEyes.tsx and ClippoAvatar.tsx has initial valid d attribute so browser avoids "d: undefined" errors.	Code	Low	High
High	Add aria-label="Enviar mensaje" / "Send message" to submit buttons in ContactTerminal.tsx and ChatInput.tsx to resolve Lighthouse 0-score on button-name audit.	A11y	Low	Med
Medium	Unify H1 hierarchy: Convert "Certifications& Credentials" from <h1> to <h2> (and add missing space). Preserve	SEO	Low	Med

	single monumental <h1> for Rodrigo Martel.			
Quick Win	Deploy /public/lms.txt summarizing Rodrigo Martel, core capabilities (Make, Zapier, Python, Salesforce), project case studies, and contact options for AI search engines.	GEO	Low	High

7. What Is Working Exceptionally Well

- **100/100 Lighthouse SEO Score:** Flawless baseline metadata, canonical references, viewport configuration, and descriptive alt attributes on all images.
- **Comprehensive Entity Schema:** Person, WebSite, ProfilePage, and FAQPage nodes interconnected in JSON-LD establish undisputed practitioner authority.
- **Concrete, Quantifiable Case Studies:** Case studies highlight measurable outcomes (+240% inbound leads, 99.4% uptime) rather than generic fluff.
- **Architectural Typography & Brand Identity:** Monumental typography with smooth responsive scaling provides high-end visual appeal.

8. Glossary of Terms

- **SEO (Search Engine Optimization):** Optimizing content and code structure to rank organically in search engine result pages (Google, Bing).
- **GEO (Generative Engine Optimization):** Formatting and structuring authoritative data, credentials, and facts so AI synthesis models (Perplexity, ChatGPT, Gemini) cite your entity.
- **AEO (Answer Engine Optimization):** Crafting concise, direct question-and-answer content patterns suitable for featured snippets and voice search assistants.
- **Core Web Vitals:** Google user experience metrics measuring loading speed (LCP), interactivity/responsiveness (INP/TBT), and visual stability (CLS).
